Bug name	How to solve
Wrong path name	1. After run bookings app, we can't load the home page.
for templates	The log shows like this:
	2022/04/01 10:44:46 Connected to database
	2022/04/01 10:44:46 Connected to database INFO 2022/04/01 10:44:46 Starting mail listener!
	Starting application on port: :8080
	2022/04/01 10:44:55 Hit the page: localhost:8080/
	2022/04/01 10:44:55 Could not get templates from cache
	2022/04/01 10:44:55 Hit the page: localhost:8080/favicon.ico
	 2. Conclusion: Function Template can't get the template from disk. But it still get favicon.ico → After a few checking, I found that the problem due to the path to html template. → From the root folder of project, correct the path to templates folder. 3. Rerun app and reload homepage.
Wrong Postgres	1. query wrong in func InsertRoomRestriction
query syntax	query := `
	insert into room_restriction
	(start_date, end_date, roomID, reservationID , created_at, updated_at,
	restrictionID)
	values (\$1, \$2, \$3, \$4, \$5, \$6, \$7)
	2. Conclusion: Taking the error and search in google \rightarrow Stackoverflow \rightarrow Problem happens when query database (non-exist column).
	<pre>3. Correct query query := `insert into room_restriction</pre>
	(start_date, end_date, room_id, reservation_id , created_at, updated_at, restriction_id) values (\$1, \$2, \$3, \$4, \$5, \$6, \$7)\ You, 2 months ago • Design models, connect Pos
6 / 1 1 1	4. Perform again insert query, go to Dbeaver to check room_restriction table
Can't query data in	1. Error: "cant find table and cant query cross-database"
another Postgresql database	2. My solution: Correct access to the database that need to query.
uatabase	I also found way to query cross-database, maybe using in future:
	https://stackoverflow.com/questions/48475220/join-tables-from-different-databases-postgresql
	<u>databases-postgresqr</u>

Forgot where clause so the query update	My ideas: First, separate the database for testInDevelopment and production. Second, backup the database for production: Periodic backup the database and storing several places in local laptop, in the server in could, in google drive,					
entire database	storing several		ai iaptop, in the se
